

AN APPARATUS, METHOD, PROGRAM, AND RECORDING MEDIUM FOR
INGREDIENT INFORMATION MANAGEMENT

ABSTRACT OF THE DISCLOSURE

A conventional ingredient information management apparatus has a problem that a combination of the information about new dishes using the ingredients remaining at the last cooking cannot be obtained before setting the conditions, including the ingredients remaining, at the last cooking.

The problem is solved by an ingredient information management apparatus having a means for computing the information about new dishes using the ingredients assumed to remain at the last cooking based on the menu discrimination information from a member received by the ingredient information management apparatus, and the distribution date DB 111, menu DB 120, sale unit DB 150, member DB 130, and shop DB.
